

The last several decades have seen a significant increase in immigration to the United States. Today, more than 20% of American children age 17 and younger have at least one foreign-born parent, and about 30% of these children are themselves foreign-born.

Immigrant youths in the United States tend to adapt extremely well to their new surroundings. Researchers report that immigrant students often perform in school as well or better than their US-born classmates. Studies assessing psychological adjustment reveal similar findings: Foreign-born students are less likely to abuse alcohol or break the law, and they demonstrate relatively higher levels of self-esteem than their US-born peers.

The following quotations are responses from overachieving immigrant middle school students when asked by interviewers to explain their success:

Student 1, eighth-grade valedictorian: "When my mother first came to the United States from China, she spent all her time working, trying to earn a living to support her three children. I know how much she has sacrificed, and I am so grateful that I am willing to do just about anything for her."

Student 2, a straight-A student: "[In my neighborhood] everyone knows everyone. They all know what I am up to, so I want to make a good impression and have them think highly of me. I also want to represent my community well to others."

Even though immigrant families are often more prosperous in the United States than they were in their home countries, they still often struggle financially, typically due to parental language barriers. The impressive adaptations of immigrant students occur despite impoverished circumstances; their parents tend to emphasize the importance of education as a means to attaining prosperity, reminding their children that they immigrated to provide their children with access to better education than was available in their homeland. Immigrant children tend to internalize their parents' attitude toward educational achievement.

Members of ethnic minorities in the United States also stress loyalty to family and community over self, so children feel a strong sense of gratitude and allegiance to their parents. Immigrant parents with successful children have usually formed close relationships with members of their ethnic community; members of ethnic enclaves tend to demonstrate consensus on values and exert an unusually high level of control over the children's behavior through regular monitoring.

According to Kohlberg's theory of moral development, which of the following is most likely to motivate Student 2 to work hard in school?

- ☐ A. Fear of being punished [14%]
- ☐ B. Expectation of a reward [11%]
- ✓ ☒ C. Praise from parents [44%]
- ☐ D. Internal standards of success [29%]

Correct

43% answered correctly

Explanation:

Kohlberg Stages of Moral Development			
Level	Defined by	Stage	Moral reasoning
Pre-conventional	Direct consequences to the individual	1. Obedience & punishment	Avoiding punishment by authority <i>(eg, I'm not going to steal because I'll get spanked)</i>
		2. Self-interest	Expecting equal exchange to further own self-interest <i>(eg, I'll help you if you help me)</i>
Conventional	Society's norms & values	3. Conformity & interpersonal accord	Wanting to be "good" to secure the approval of others <i>(eg, I'll do my homework so the teacher likes me)</i>
		4. Law & order	Obedying laws of society <i>(eg, I'm not going to speed because it's against the law)</i>
Post-conventional	Own ethical principles	5. Social contract	Maximizing benefit for the largest number of people <i>(eg, It's okay to break a law if it saves a life)</i>
		6. Universal ethical principles	Following own ethical principle of justice above all else <i>(eg, I take action against laws violating basic human rights)</i>

Lawrence **Kohlberg** proposed a theory of **moral development** progressing through six stages in sequence, but did not assign age ranges to the stages. He also asserted that most adults do not progress past stage 3 or 4.

At the **pre-conventional level**, morality is controlled by outside forces: Individuals attempt to avoid punishment (stage 1) and try to maximize an exchange of favors with others (stage

2). At the **conventional level**, morality is defined by existing social norms and values: Individuals want to be "good" and liked by others (stage 3) and obey laws (stage 4). At the

post-conventional level, morality is based on universal moral principles: Laws are viewed as flexible, considered in the context of helping the greatest number of people (stage 5), and justice and human dignity apply universally to all people (stage 6).

Student 2's quote reflects a desire to be seen as "good" and secure the approval of others (stage 3); therefore, the individual should be most motivated to work hard in school by praise from the parents.

(Choice A) Student 2's quote does not indicate a concern about punishment by authority (stage 1), so this student is unlikely to be most motivated by fear of punishment.

(Choice B) Student 2's quote does not reflect a concern for self-reward (stage 2), so this individual is unlikely to be most motivated by a reward.

(Choice D) Student 2's quote does not reflect a level of moral development in which the individual is motivated by internal standards (post-conventional level).

Educational objective:

Kohlberg proposed a theory of moral development in six stages. At the pre-conventional level, morality is externally controlled by punishment (stage 1) and reciprocity with others (stage 2). At the conventional level, morality is based on conforming to norms (stage 3) and obeying the law (stage 4). At the post-conventional level, which few people achieve, morality is based on a social contract (stage 5) and a personal code of ethics (stage 6).

Student 1, eighth-grade valedictorian: "When my mother first came to the United States from China, she spent all her time working, trying to earn a living to support her three children. I know how much she has sacrificed, and I am so grateful that I am willing to do just about anything for her."

Student 2, a straight-A student: "[In my neighborhood] everyone knows everyone. They all know what I am up to, so I want to make a good impression and have them think highly of me. I also want to represent my community well to others."

Even though immigrant families are often more prosperous in the United States than they were in their home countries, they still often struggle financially, typically due to parental language barriers. The impressive adaptations of immigrant students occur despite impoverished circumstances; their parents tend to emphasize the importance of education as a means to attaining prosperity, reminding their children that they immigrated to provide their children with access to better education than was available in their homeland. Immigrant children tend to internalize their parents' attitude toward educational achievement.

Members of ethnic minorities in the United States also stress loyalty to family and community over self, so children feel a strong sense of gratitude and allegiance to their parents. Immigrant parents with successful children have usually formed close relationships with members of their ethnic community; members of ethnic enclaves tend to demonstrate consensus on values and exert an unusually high level of control over the children's behavior through regular monitoring.

Which of the following best illustrates the diffusion of material culture?

- ☐ A. Immigrant children learn behavioral norms from their school peers. [2%]
- ☒ B. Immigrant youths dress more like their classmates than like their parents. [83%]
- ☐ C. Immigrant children learn how to cook native foods from their parents. [12%]
- ☐ D. Immigrants tend to live near each other and share similar values. [1%]

Correct

82% answered correctly

Explanation:

	Definition	Example
Symbolic culture	Nonmaterial aspects of a society used to communicate & convey meaning	Folklore, values, laws
Material culture	Physical items valued by society	Clothing, tools, computers
Cultural transmission	Passing on of information from an older generation to a younger generation	A child learns how to cook from a parent
Cultural diffusion	Spreading of culture from one group to another	People in the United States celebrate Cinco de Mayo

Culture is defined by the behaviors, beliefs, objects, and other socially defined constructs (eg, race, religion) shared by a group of people. **Material culture** refers to the **physical items** these individuals create, use, and/or interact with, such as buildings, clothing, and technology. **Symbolic culture** (or nonmaterial culture) refers to the **intangible elements** of a culture, such as language, beliefs, and values.

Cultural diffusion involves the **spread** of culture (material, nonmaterial, or both) from **one group** of people to **another**. Immigrant children who begin to dress more like their classmates than like their parents are illustrating the *diffusion* of *material* culture.

(Choice A) Immigrant children learning the norms and behaviors (ie, intangible elements) of their new culture through interactions with peers at school illustrates the diffusion of *symbolic* culture.

(Choice C) Cultural transmission describes the passing of cultural elements (material, nonmaterial, or both) from one generation to the next. Immigrant children who learn how to cook native foods from their parents are illustrating the transmission (not diffusion) of material culture.

(Choice D) Immigrants living near each other and sharing similar values illustrate the transmission (not diffusion) of symbolic (not material) culture.

Educational objective:

Culture refers to group bonds created by shared objects, ideas, values, or beliefs. Material culture includes all physical objects created or used by the group (eg, buildings, clothing); symbolic or nonmaterial culture includes all intangible products of a culture (eg, language, laws). Cultural diffusion is the spread of culture (material, nonmaterial, or both) from one group to another.

The last several decades have seen a significant increase in immigration to the United States. Today, more than 20% of American children age 17 and younger have at least one foreign-born parent, and about 30% of these children are themselves foreign-born.

Immigrant youths in the United States tend to adapt extremely well to their new surroundings. Researchers report that immigrant students often perform in school as well or better than their US-born classmates. Studies assessing psychological adjustment reveal similar findings: Foreign-born students are less likely to abuse alcohol or break the law, and they demonstrate relatively higher levels of self-esteem than their US-born peers.

The following quotations are responses from overachieving immigrant middle school students when asked by interviewers to explain their success:

Student 1, eighth-grade valedictorian: "When my mother first came to the United States from China, she spent all her time working, trying to earn a living to support her three children. I know how much she has sacrificed, and I am so grateful that I am willing to do just about anything for her."

Student 2, a straight-A student: "[In my neighborhood] everyone knows everyone. They all know what I am up to, so I want to make a good impression and have them think highly of me. I also want to represent my community well to others."

Even though immigrant families are often more prosperous in the United States than they were in their home countries, they still often struggle financially, typically due to parental language barriers. The impressive adaptations of immigrant students occur despite impoverished circumstances; their parents tend to emphasize the importance of education as a means to attaining prosperity, reminding their children that they immigrated to provide their children with access to better education than was available in their homeland. Immigrant children tend to internalize their parents' attitude toward educational achievement.

Members of ethnic minorities in the United States also stress loyalty to family and community over self, so children feel a strong sense of gratitude and allegiance to their parents. Immigrant parents with successful children have usually formed close relationships with members of their ethnic community; members of ethnic enclaves tend to demonstrate consensus on values and exert an unusually high level of control over the children's behavior through regular monitoring.

If Student 1 has progressed to identity achievement status, how would the student most likely respond to the question, "Would you change your career choice if a better option came along?"

✔ ☒ A. "I don't think so; I've made my career decision carefully and I'm committed to my choice." [56%]

☐ B. "My family is in agreement about my career path, so I already know where I am

going." [24%]

- ☐ C. "I haven't really thought about it that much because it makes no difference to me." [1%]
- ☐ D. "You never know what the future holds, so if something better comes along I would consider it." [17%]

Correct

57% answered correctly

Explanation:

The identity development theory by James **Marcia** evaluates the psychological progress of individuals based on their **level of commitment** and **degree of exploration**, yielding four identity statuses.

- Identity **diffusion** (low commitment, low exploration): People at this level lack direction, have not explored options, and have not committed to a particular career path or future.
- Identity **foreclosure** (high commitment, low exploration): People at this level have accepted an identity that they have been assigned (typically by a parent or authority figure) without contemplation or exploration.
- Identity **moratorium** (low commitment, high exploration): People at this level are still trying new activities and thinking about a career path, but have not yet arrived at a decision.
- Identity **achievement** (high commitment, high exploration): People at this level have explored their options and typically feel confident about who they are and what they want to do in the future.

If Student 1 has reached identity achievement status, the student is most likely to respond with, "I don't think so; I've made my career decision carefully and I'm committed to my choice."

(Choice B) This quotation suggests identity foreclosure because it indicates that parents have already made the decision without describing any effort to explore options.

(Choice C) This quotation suggests identity diffusion because it expresses no commitment to a future goal and no willingness to think about options.

(Choice D) This quotation suggests no commitment and therefore does not reflect an identity achievement status.

Educational objective:

Marcia outlines four identity statuses depending on a person's level of commitment and

exploration: Identity diffusion (low commitment, low exploration), identity foreclosure (high commitment, low exploration), identity moratorium (low commitment, high exploration), and

identity achievement (high commitment, high exploration).

The last several decades have seen a significant increase in immigration to the United States. Today, more than 20% of American children age 17 and younger have at least one foreign-born parent, and about 30% of these children are themselves foreign-born.

Immigrant youths in the United States tend to adapt extremely well to their new surroundings. Researchers report that immigrant students often perform in school as well or better than their US-born classmates. Studies assessing psychological adjustment reveal similar findings: Foreign-born students are less likely to abuse alcohol or break the law, and they demonstrate relatively higher levels of self-esteem than their US-born peers.

The following quotations are responses from overachieving immigrant middle school students when asked by interviewers to explain their success:

Student 1, eighth-grade valedictorian: "When my mother first came to the United States from China, she spent all her time working, trying to earn a living to support her three children. I know how much she has sacrificed, and I am so grateful that I am willing to do just about anything for her."

Student 2, a straight-A student: "[In my neighborhood] everyone knows everyone. They all know what I am up to, so I want to make a good impression and have them think highly of me. I also want to represent my community well to others."

Even though immigrant families are often more prosperous in the United States than they were in their home countries, they still often struggle financially, typically due to parental language barriers. The impressive adaptations of immigrant students occur despite impoverished circumstances; their parents tend to emphasize the importance of education as a means to attaining prosperity, reminding their children that they immigrated to provide their children with access to better education than was available in their homeland. Immigrant children tend to internalize their parents' attitude toward educational achievement.

Members of ethnic minorities in the United States also stress loyalty to family and community over self, so children feel a strong sense of gratitude and allegiance to their parents. Immigrant parents with successful children have usually formed close relationships with members of their ethnic community; members of ethnic enclaves tend to demonstrate consensus on values and exert an unusually high level of control over the children's behavior through regular monitoring.

The findings on immigrant youths' overall adjustment to their new surroundings (Paragraph 2) best reflects immigrant youths':

- ☐ A. inability to culturally assimilate. [1%]
- ☐ B. avoidance of cultural lag. [12%]
- ✔ ☒ C. ability to overcome culture shock. [83%]
- ☐ D. susceptibility to ethnocentrism. [1%]

Correct

83% answered correctly

Explanation:

Elements of culture shock	
	Unpleasant emotions associated with new culture:

Characteristics	• Disorientation • Anxiety • Fear
Causes	• Language barriers • Unfamiliar symbols, signs • Different norms, values • Difficulty interpreting behavior

Culture refers to the behaviors, beliefs, and general way of life of a particular society at a particular time. When people move to a new country, they face the challenge of acculturation, or adapting to the culture of their new country. Immigrating to a new country often results in **culture shock**: feelings of **disorientation**, **uneasiness**, and even **fear** due to the unfamiliar culture. The biggest causes of culture shock include difficulty communicating due to language barriers and unfamiliarity with symbols, norms, and customs.

The fact that immigrant youths tend to adapt extremely well to their new culture (Paragraph 2) reflects their ability to *overcome culture shock*.

(Choice A) Assimilation occurs when people adopt the culture of their new country, replacing the culture of their native country. Immigrant youths appear to adjust well to their new surroundings, which reflects an *ability* (not inability) to culturally assimilate.

(Choice B) Culture lag refers to the social problems created by the time delay between rapid changes in material culture (technology, fashion) and slower changes in nonmaterial culture (ideas, beliefs, laws). For example, the Internet has evolved faster than have the laws needed to protect the safety of minors while online. Societies (not individuals) experience culture lag, so avoidance of cultural lag is not relevant to the adjustment of immigrant youths.

(Choice D) Ethnocentrism is the belief that other cultures are inferior to the dominant culture. Ethnocentrism may result in discrimination, unfair treatment based on culture or ethnic affiliation. Immigrants often face ethnocentric beliefs and practices, yet immigrant children appear to prevail *in spite of* ethnocentrism, suggesting that their overall adjustment to new surroundings does not best reflect susceptibility to ethnocentrism.

Educational objective:

Culture shock involves negative feelings associated with immersion in an unfamiliar culture, such as anxiety and disorientation. Culture shock largely results from language barriers and unfamiliar norms and symbols.

The following quotations are responses from overachieving immigrant middle school students when asked by interviewers to explain their success:

Student 1, eighth-grade valedictorian: "When my mother first came to the United States from China, she spent all her time working, trying to earn a living to support her three children. I know how much she has sacrificed, and I am so grateful that I am willing to do just about anything for her."

Student 2, a straight-A student: "[In my neighborhood] everyone knows everyone. They all know what I am up to, so I want to make a good impression and have them think highly of me. I also want to represent my community well to others."

Even though immigrant families are often more prosperous in the United States than they were in their home countries, they still often struggle financially, typically due to parental language barriers. The impressive adaptations of immigrant students occur despite impoverished circumstances; their parents tend to emphasize the importance of education as a means to attaining prosperity, reminding their children that they immigrated to provide their children with access to better education than was available in their homeland. Immigrant children tend to internalize their parents' attitude toward educational achievement.

Members of ethnic minorities in the United States also stress loyalty to family and community over self, so children feel a strong sense of gratitude and allegiance to their parents. Immigrant parents with successful children have usually formed close relationships with members of their ethnic community; members of ethnic enclaves tend to demonstrate consensus on values and exert an unusually high level of control over the children's behavior through regular monitoring.

Which concept best explains why it CANNOT be concluded that American students are underperforming academically compared to students in other countries, based on the passage's comparison between immigrant children and their US-born classmates?

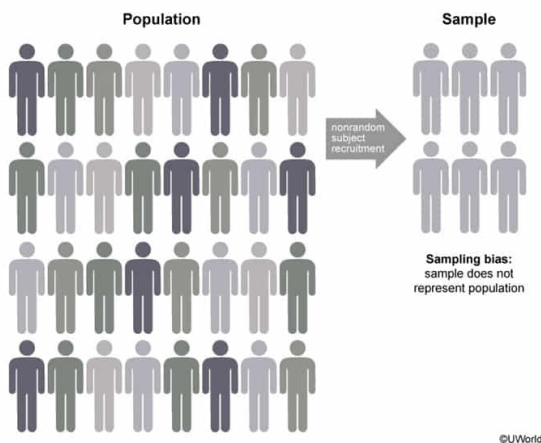

- ☐ A. Social desirability bias [11%]
- ☐ B. Confirmation bias [12%]
- ☐ C. Hindsight bias [14%]

✓ ☒ D. Sampling bias [61%]

Correct

61% answered correctly

Explanation:

In scientific research, bias occurs when the data are systematically influenced by an aspect of the study design (eg, sampling bias) or by the subjects (eg, social desirability bias).

Sampling bias occurs when study participants are recruited from a population nonrandomly. Nonrandom sampling strategies can result in **nonrepresentative samples**, those that **do not reflect** the overall **characteristics** of the **population** of interest. For example, **convenience sampling** describes a nonrandom process of selecting participants who are easy to access in some way (eg, geographic location).

Immigrant children *in America* (convenience sample) are not representative of students *in other countries* because there are likely to be fundamental differences between families that have immigrated and those that have not. In other words, sampling bias best explains why researchers cannot conclude that American students are underperforming academically compared to students *in other countries* based on data from immigrant children.

(Choice A) Social desirability bias describes the tendency of research participants to overemphasize positive behaviors (eg, studying) while downplaying or underreporting undesirable behaviors (eg, consuming alcohol). This bias fails to explain why the comparison between American and foreign students is inappropriate.

(Choice B) Confirmation bias describes the tendency, when one has already formed a conclusion, to look for supporting information, ignoring undermining information. This bias fails to explain why the comparison between American and foreign students is inappropriate.

(Choice C) Hindsight bias describes the tendency to perceive an event as being likely after it has occurred, even if it was unlikely (eg, after winning the lottery, the winner states that she knew it was a lucky ticket). This bias fails to explain why the comparison between American and foreign students is inappropriate.

Educational objective:

Sampling bias is the result of nonrandom study sampling techniques (eg, convenience sampling) that produce nonrepresentative samples from which conclusions about the larger population cannot be drawn.

Members of ethnic minorities in the United States also stress loyalty to family and community over self, so children feel a strong sense of gratitude and allegiance to their parents. Immigrant parents with successful children have usually formed close relationships with members of their ethnic community; members of ethnic enclaves tend to demonstrate consensus on values and exert an unusually high level of control over the children's behavior through regular monitoring.

As described in the passage, the success of immigrant youths:

- ☐ A. appears to be the result of social and economic capital. [8%]
- ☐ B. appears to result from social reproduction and intersectionality. [21%]
- ☒ C. demonstrates intergenerational and intragenerational mobility. [64%]
- ☐ D. demonstrates class consciousness and false consciousness. [5%]

Correct

63% answered correctly

Explanation:

		Types of social mobility		
		Direction of movement		
Time frame of movement		No change in social status ←→	Increase in social status ↑	Decrease in social status ↓
	1 Generation	Intragenerational horizontal mobility (eg, doctor moves her practice from Atlanta to Chicago)	Intragenerational upward mobility (eg, after 10 years, nurse goes back to school to earn MD)	Intragenerational downward mobility (eg, doctor loses license to practice medicine)
	2+ Generations	Intergenerational horizontal mobility (eg, son of doctors becomes a doctor)	Intergenerational upward mobility (eg, son of high school drop-outs becomes a doctor)	Intergenerational downward mobility (eg, son of doctors becomes a high school drop-out)

© UWorld

The term **social mobility** refers to the change or **movement of individuals**, groups, or families between or within **status** categories in society (eg, from middle class to upper class). Social mobility can be horizontal, upward, or downward and is related to a multitude of other factors, such as educational achievement, job loss, career advancement, marriage, and institutionalized discrimination.

If a group or a person experiences social mobility within one's own lifetime, the social mobility is said to be **intragenerational**, occurring within a generation. Social mobility that takes place over more than one life span is **intergenerational**, occurring during the span of more than one generation.

The success of immigrant youths appears to be both intergenerational and intragenerational. It is intragenerational because the parents typically achieve a more prosperous status in the United States than in their native country. It is also intergenerational because the children achieve better education than their parents, with the potential for additional social advancement.

(Choice A) Although social capital (defined as one's social network) appears to factor into the success of immigrant youths, economic capital (defined as one's financial resources) does not because the passage states that immigrant students succeed *despite* financial hardships.

(Choice B) Social reproduction refers to the transmission of social inequality between generations (eg, children of poor parents remain poor), which is not occurring for the immigrant children since their status is likely to exceed that of their parents.

Intersectionality refers to the way social categories (race, gender, class) overlap and contribute to discrimination and oppression; immigrant children appear to be succeeding *despite* intersectionality.

(Choice D) Class consciousness is an awareness of one's social status in society (which is necessary for social classes to unite in revolution), and false consciousness refers to an inaccurate assessment of one's own status. Neither concept explains the success of

immigrant youths.

Educational objective:

Social mobility refers to the change in social status experienced by a group or individual. It may be upward or downward and may be intragenerational (occurring over a relatively short time among members of the same generation) or intergenerational (occurring over a relatively long time among members of different generations).
