

Neighborhoods A and B are next to each other in a large urban area. If Neighborhood A is more gentrified than Neighborhood B, which of the following is most likely?

- ☐ A. Housing and rental prices are more affordable in Neighborhood A than in Neighborhood B. [4%]
- ☐ B. Residents have resided in Neighborhood A for a longer median duration than in Neighborhood B. [4%]
- ✓ ☒ C. More lower-income residents have been displaced from Neighborhood A than from Neighborhood B. [90%]
- ☐ D. The tax base for Neighborhood A is smaller than the tax base for Neighborhood B. [1%]

Correct

90% answered correctly

Explanation:

Gentrification is the **redevelopment** of lower-income **urban** (city) neighborhoods that occurs in conjunction with an influx of higher-income individuals, resulting in the **displacement of lower-income residents**.

As higher-income individuals move to a lower-income neighborhood, it is redeveloped (ie, new/improved homes and businesses) and housing prices increase. No longer able to afford to live in their neighborhood, lower-income residents are displaced (forced to move), and the influx of higher-income individuals and redevelopment continues. This cycle gradually transforms lower-income urban neighborhoods into higher-income urban neighborhoods.

Because gentrification results in the displacement of lower-income residents, more lower-income residents will have been displaced from Neighborhood A (the *more gentrified* neighborhood) than from Neighborhood B.

(Choice A) Gentrification causes housing and rental prices to increase. Therefore, housing and rental prices should be *less* (not more) affordable in Neighborhood A than in Neighborhood B.

(Choice B) Gentrification results in many long-term residents getting priced out of (displaced from) their neighborhood as housing and rental prices increase. Therefore, residents will have resided for less time—a *shorter* (not longer) median duration—in Neighborhood A compared to Neighborhood B.

(Choice D) The tax base includes all the assets (eg, property) and revenue (eg, business transactions) that are taxed by the government. Gentrification causes the local tax base to expand as the result of higher property values and new businesses. Therefore, Neighborhood A will have a *larger* (not smaller) tax base than Neighborhood B.

Educational objective:

Gentrification is a process of urban redevelopment of lower-income neighborhoods that occurs with an influx of higher-income residents. Gentrification causes an increase in housing prices, which forces lower-income residents to move (displacement).

Which of the following is true regarding the social stratification system referred to as a caste system?
Caste systems have status positions that are:

- ☐ A. achieved, which makes social mobility difficult.
- ✓ ☒ B. ascribed, which makes social mobility difficult. [94%]
- ☐ C. achieved, which makes social mobility possible. [2%]
- ☐ D. ascribed, which makes social mobility possible. [1%]

Correct

94% answered correctly

Explanation:

Social stratification: Caste vs. class systems	
Caste system	Class system
• Individual social status is ascribed from birth • Social groupings are rigid • Social mobility is very difficult	• Individual social status is at least partially achieved through merit (eg, ability, hard work) • Social groupings are flexible/fluid • Social mobility is possible

Social stratification refers to a **system of inequality** in society whereby individuals are grouped into hierarchical social categories that have differential access to resources, opportunities, and life outcomes. Class systems and caste systems are two types of social stratification systems.

In a **class system** (eg, United States), the social class individuals are born into influences their opportunities and resources. However, an individual's **status** is at least partially **achieved** (voluntarily earned) through effort and/or ability. Social status is less clearly defined and boundaries between classes are not definite. Therefore, **social mobility** (movement between classes) is **possible**.

In a **caste system** (eg, India), an individual's **status** is **ascribed** (involuntarily assigned) based on personal characteristics such as race, ethnicity, or parental caste. Individuals tend to remain in the same caste for life and are discouraged (formally and informally) from intimate contact with individuals in other castes. Therefore, **social mobility** (movement between castes) is very **difficult**.

(Choices A, C, and D) In caste systems, social status is ascribed (assigned) to individuals at birth rather than achieved (earned), which significantly hinders social mobility (movement up or down in status).

Educational objective:

Social stratification refers to a system of inequality whereby individuals are hierarchically ranked into groups that have differing access to resources, opportunities, and life outcomes. In caste systems, social status is ascribed and caste boundaries are rigid, making social mobility difficult. In class systems, social status is at least partially achieved and class boundaries are less defined, making social mobility possible.
