

Which of the following best illustrates a normative organization?

- ☐ A. A residency program for physicians specializing in surgery [30%]
- ☐ B. An inpatient psychiatric ward where patients are involuntarily committed [5%]
- ☐ C. An insurance company employing physicians as paid consultants [7%]
- ✓ ☒ D. A humanitarian group composed of volunteer physicians [56%]

Correct

57% answered correctly

Explanation:

Normative	Utilitarian	Coercive
Membership is based on shared goals and/or values	Membership is driven by compensation (ie, money or certification/diplomas)	Membership is not freely chosen and/or maintained

In sociology, **organizations** are social structures composed of individuals linked by specific purposes, tasks, and/or common goals. The three main types of organizations are normative, utilitarian, and coercive.

- In **normative** organizations, people voluntarily unite based on **shared values** and/or **goals** (eg, church congregations, sororities).
- In **utilitarian** organizations, members are **compensated** for their involvement, typically through money (eg, paid employment) or certification/diploma (eg, university students).
- In **coercive** organizations, **membership is not freely**

chosen (eg, prisoners) and/or maintained (eg, military service members must be discharged).

A humanitarian group composed of physician volunteers illustrates an organization in which members are united by shared values and/or goals (ie, a *normative* organization).

(Choices A and C) Medical residents and business consultants are compensated for their efforts in a residency program and the workforce, respectively (ie, through certification, pay). Therefore, both a medical residency program and an insurance company that employs physicians as consultants illustrate *utilitarian*, not normative, organizations.

(Choice B) An inpatient psychiatric ward in which involuntarily committed patients are unable to leave as they choose (ie, they must be evaluated and cleared by staff) illustrates a *coercive*, not a normative, organization.

Educational objective:

Organizations are social structures composed of individuals linked by specific purposes, tasks, and/or common goals. In normative organizations, people come together based on shared values/goals, whereas utilitarian organizations compensate members for their involvement. In coercive organizations, membership is not freely chosen and/or maintained.

Researchers hypothesized that student nurses make more errors when they train under the supervision of an instructor who has low expectations for their competency. Which statement is accurate regarding research designed to test this hypothesis?

- ☐ A. Results showing a teacher expectancy effect would not support the researcher's hypothesis. [1%]
- ☐ B. If the hypothesis is confirmed, the results would suggest the presence of the Hawthorne effect. [15%]
- ✓ ☒ C. Instructors' expectations of the student nurses would be the independent variable. [76%]
- ☐ D. To test the hypothesis, the severity of errors would need to be operationalized. [6%]

Correct

75% answered correctly

Explanation:

The **teacher expectancy effect** describes what occurs when a teacher's **preconceived ideas** about a student (eg, "he is lazy") result in **student performance** that ultimately **meets** the teacher's **expectations**. Students may overperform (when the teacher has high expectations) or underperform (when the teacher has low expectations).

The teacher expectancy effect is thought to occur because teachers' beliefs unconsciously influence their actions, causing them to treat students differently (eg, giving less feedback to a student believed to be lazy).

Students then perform in a manner that reinforces the teacher's beliefs.

Research that tests whether student nurses make more errors when they train under the supervision of an instructor who has low expectations for their competency is based on the teacher expectancy effect. Instructors' expectations of the student nurses is the *independent variable*, which is manipulated/controlled by the researchers to determine the effect on the *dependent variable* (ie, number of errors made).

(Choice A) Results showing a teacher expectancy effect (ie, student nurses *do* make more errors when their instructors have low expectations for their competency) would *support* the researcher's hypothesis.

(Choice B) The Hawthorne effect describes research subjects acting differently as a result of knowing that they are being observed. Results confirming the hypothesis (student nurses make more errors when their instructor has low expectations for their competency) suggest the presence of the *teacher expectancy* (not Hawthorne) effect.

(Choice D) The hypothesis, which was that low teacher expectations would lead to *more* (ie, a greater number of) errors, did not relate to the *severity of* errors. Therefore, to test the hypothesis, severity of errors would *not* need to be operationalized (ie, defined for measurement purposes).

Educational objective:

The teacher expectancy effect refers to a teacher's preconceived ideas about a student resulting in student performance that meets the teacher's expectations. Independent variables are manipulated/controlled by the researcher to examine the impact on the dependent variable.
